

How many servings are there per bottle in intraMAX®?

Each bottle contains 33 ounces (or servings) of product. Each serving will provide your Optimum Daily Allowance (ODA) of essential nutrients plus much more (415+ ingredients). To achieve the same results, it is not uncommon for people to spend \$300 per month on a variety of supplements. Taking intraMAX is a nutritionally efficient and cost effective means to achieving good health.

Why are Drucker Labs' products in liquid form?

Without applying any heat in the manufacturing process, the only way to maintain the Carbon-bond Organic state of intraMAX is in liquid form. The vast majority of pills, tablets, and capsules use heat in the manufacturing process and typically include additives, preservatives, chemicals, agents, excipients, coatings, and other synthetic chemical materials. In its liquid form, intraMAX is all natural and rapidly absorbed.

How do I take Drucker Labs' products?

Our products are best recommended by a Health-Care Professional (HCP) who has been instructed and trained by Drucker Labs. We publish a protocol pad for use by the HCP to recommend the product quickly and effectively. These pads are provided free of charge at www.druckerlabs.com. The HCP should monitor the patient's progress and make changes in dosages accordingly.

What is Drucker Labs' proprietary process?

The latest intraCELL V Technology™ quickly converts inorganic nutrients and elements into carbon-bond organic nutrients for maximum intra-cellular absorption, utilization, bioavailability, and performance. intraCELL V Technology is a culmination of over 20 years of Dr. Drucker's research, testing, and analysis. The technology is capable of surrounding (polymerizing) a molecule with organic carbon, then breaking it down into new polymerized, ultra-chelated, re-structured molecules. These new molecules now have ultra-low molecular weight and size. Our intraCELL V Technology enables and carries critical organic nutrition into the cell rapidly.

Can I take this with pharmaceuticals or other nutraceuticals?

Because the Carbon-bond Organic microcomplexes™ may dramatically enhance the absorption of other products, please do NOT take any other pharmaceuticals and/or nutraceuticals either 2 hours before or 2 hours after your dose. You may resume other pharmaceuticals and/or other nutraceuticals any time 2 hours before or after your dose.

What is a true Organic mineral?

A true organic mineral contains organic carbon (not inorganic synthetic carbonate). Minerals are required by cells as catalysts for proper nutrition. Without minerals, cells cannot function. Minerals are an essential key to sustaining life.

Do I get enough Organic minerals from my food?

No. Most of us get very few minerals and not nearly what our bodies require to function optimally. Modern U.S. farming techniques have drastically increased the use of toxic chemicals, pesticides, and inorganic fertilizers. The 74th U.S. Congress categorically declared that 99% of Americans are deficient in organic trace minerals because modern "U.S. economic-based" farming and agricultural practices have destroyed our foods via eradication and near extinction of most critical, life-sustaining organic complexes, trace minerals, and elements from our soils. These critical organic complexes and elements were at one time present in the soils before "U.S. economic-based" farming practices began in the mid 1930's.

Can I mix the intra products in a smoothie?

No. Our intra products are specially formulated to be taken by themselves with at least 8 to 10 oz. of filtered, **non-chlorinated** or bottled spring water. These products should NOT be mixed within a protein drink, a smoothie, fruit juice, vegetable juice, or mixed into a salad dressing. The proprietary intraCELL V Technology may cause the ingredients to bind to whatever food source there is and amplify it (or render it ineffective). This binding tendency is why the intra products are to be taken on an empty stomach and taken two hours before or after pharmaceuticals or nutraceuticals (at least 30-minutes before or after any food intake).

I am sensitive to iron supplements. Will the iron in intraMAX affect me?

No. Because of the small size and its encasement in carbon (like the other 415+ nutrients), the iron will be absorbed readily by your body if it is required or passed through the system without harm if it is not required. This process is similar to the way iron-bearing foods are treated. For example, spinach is loaded with iron, but we do not ask patients to cut back on spinach due to iron overload. The body simply passes on the items it does not need due to the presence of Organic carbon.

Should I take intraMAX every day?

Almost. It should be taken six days a week with a day off. You need consistency and quality in your daily supplementation. Like exercising, though, we believe that it is best to give the body a day of rest. intraMAX constantly provides the body with vital nutrients and helps to achieve gentle detoxification. If you take the same amount the same time every day, it is possible that the body may acclimate to it.

Is Drucker Labs a multi-level marketing company?

No. Our intra product line is sold exclusively to Health-Care Professionals who recommend it to their patients and clients.

Should I take Calcium-Magnesium along with intraMAX?

No. There is no need to take any extra minerals, vitamins, herbs, digestive enzymes, probiotics, or antioxidants when you take our All-In-One products (intraMAX & intraKID™). Everything you need is included at the proper ratios. For your body to function at its maximum, you need calcium citrate, calcium succinate, and calcium ascorbate. All three are in our intraMAX and intraKID products.

Why is my urine yellow when I first take the product?

The intra products are all-natural detoxifiers. The bright yellow color you see in your urine are toxins being released. This color may last for several months depending upon your level of health-care issues. Regardless, this color is a good sign as it is an important healing process to rid your body of these internal toxins.

Why are Drucker Labs' products slightly different from bottle to bottle?

Because our products contain living Organically microcomplexed liquid minerals and nutrients with many different natural ingredients, each batch will vary slightly in color. Consider a grocery store apple: it may differ in color every time you buy it. Our products may also vary in sediment size due to our unique processing. The color and sediment size will in no way affect the potency or consistency of the product. The peach-mango flavor may vary slightly from batch to batch. Again, this is no different than the slight taste variation you may experience from an apple.

Why do I need to refrigerate Drucker Labs' products?

Because our intra products contain a significant amount of living organic material, you must refrigerate them to prevent oxidation. Cutting open an apple and exposing it to air will turn it brown in a matter of minutes. This process is similar to the process that would occur by leaving our products exposed to air. Refrigeration slows the process of oxidation. If you open a bottle and the product is black or very dark brown, this color indicates it has spoiled and you must dispose of it.
